Employee Laptop Request Application

Project Phase

Date	21 September 2026
Team ID	
Project Name	ServiceNow-Based Employee Laptop Request Application
Maximum Marks	4 Marks

ServiceNow-Based Employee Laptop Request Application:

In a large enterprise organization, employees request laptops for personal or technical work through email or informal communication. This results in non-standardized data capture, duplicate requests, delayed approvals, limited status visibility and no clear justification record.

The proposed ServiceNow solution lets employees submit a Laptop Request through a Record Producer, with the request type (Basic or Advance) and a reason captured in a controlled format. The request goes through approval, and business rules and ACLs enforce policy and security.

Objective:

To design and implement a ServiceNow Laptop Request solution that enables employees to submit laptop requests, enforces one request per employee per year, supports approval through Flow Designer, and restricts access using roles, groups and ACLs.

Skills Required:

ServiceNow Studio, Update Sets, Service Catalog, Record Producer, Flow Designer, Business Rules, Roles and ACLs, Users and Groups.

Mentor:

No mentor assigned yet

Implementation Goal:

Enable employees to raise a Laptop Request using a Record Producer; track status as Pending Approval, Approved or Rejected; enforce the annual request limit; and deploy the solution cleanly with an Update Set.

Step-1: Problem Statement and Solution Definition

Identify the limitations of email-based laptop requests, define the request process (Basic and Advance types, status tracking, justification, one request per year), and establish the required ServiceNow components.

Step-2: Solution Components and Phase Planning

Phase 1: Requirement Analysis & Planning

Define the business objective, functional scope, record producer configuration, stakeholder mapping and execution roadmap.

Phase 2: Backend Development & Configuration

Create the custom application and the Laptop Request Form table (u_laptop_request_form) with fields such as auto-number, employee reference, request type, status and reason. Configure the table relationship for approval and create the Record Producer in the Employee Service Catalog.

Phase 3: Workflow Development & Execution

Build the approval flow in Flow Designer so that requests route to the IT manager and the status updates to Approved or Rejected.

Phase 4: Business Rule Creation, Security & Validation

Create a business rule to prevent duplicate requests in a year. Create the roles it_manager (view-only) and it_employee (create and manage), the groups IT Managers and IT Employees, and the ACLs. Validate security and functionality.

Phase 5: Deployment, Final Presentation & Conclusion

Review the Update Set, resolve conflicts, commit it, export it as XML for another instance, and present the solution.

Phase 6: Conclusion

Summarize key achievements: end-to-end automated request lifecycle, role-based security with ACLs, policy enforcement through business rules, approval via Flow Designer and clean deployment.

Step-3: Expected Outcome

Employees get a simple Service Portal experience for requesting laptops, with structured data capture, consistent validation, secure access and clear approval status.

End-to-End Flow

Employee → Service Portal → Record Producer → Laptop Request Form Table → Validation (one request per year) → Approval (Flow Designer) → Status Tracking → Resolution
