Project Design Phase-II
Solution Requirements (Functional & Non-functional)

Date	13 October 2026 (documentation date)
Team ID	N/A — Individual Project
Project Name	ServiceNow-Based Employee Laptop Request Application
Maximum Marks	4 Marks

Functional Requirements

Following are the functional requirements of the Employee Laptop Request Application.

FR No.	Functional Requirement (Epic)	Sub Requirement (Story / Sub-Task)
FR-1	Laptop Request Submission	• Submit a request through the Service Portal using the “Laptop Request” Record Producer. • Capture employee, request type and reason through catalog variables.
FR-2	Request Record Creation	• Create a Laptop Request Form record in the custom ServiceNow table after successful submission. • Generate a unique request number for each created record.
FR-3	Request Type Selection	• Allow the user to select Basic (personal or general office use) or Advance (software development or technical work). • Store the selected request type on the record.
FR-4	Validation and Policy Rules	• Enforce one laptop request per employee per year using a business rule and show a clear message when a request is blocked. • Make the reason mandatory and keep the generated Number field read-only.
FR-5	Approval Workflow	• Route each new request to the IT Manager for approval using a Flow Designer flow. • Update the status to Pending Approval on creation and to Approved or Rejected after the decision.
FR-6	Role-Based Access	• Create the roles it_manager (view-only) and it_employee (create and manage) and the groups IT Managers and IT Employees. • Configure ACLs so users see and change only what their role allows.
FR-7	Portal Navigation and User Experience	• Display the Laptop Services and Request a Laptop cards on the Service Portal page. • Allow the Request Laptop action to open the Laptop Request Record Producer.
FR-8	Deployment	• Capture the configuration in an Update Set, preview and resolve conflicts, then commit it. • Export the Update Set as XML so it can be shared with another instance.

Non-functional Requirements

Following are the non-functional requirements of the proposed solution.

NFR No.	Non-Functional Requirement	Description
NFR-1	Usability	The portal provides a clear, straightforward form with labelled fields, a visible Request Laptop action and clear request type choices.
NFR-2	Security	The application relies on ServiceNow platform authentication and configured roles and ACLs. Access is restricted according to user roles and table permissions.
NFR-3	Reliability	The Record Producer maps submitted values to the custom table, while the business rule and field configuration help keep the data consistent.
NFR-4	Performance	The solution uses native ServiceNow forms, catalog variables, business rules and flows without a separate application server or external processing service.
NFR-5	Availability	The portal depends on the availability of the ServiceNow instance and its platform services. No custom high-availability infrastructure is configured.

NFR No.	Non-Functional Requirement	Description
NFR-6	Scalability	The application uses a scoped ServiceNow table and a platform-hosted portal. Capacity and scaling are managed by the ServiceNow platform; no custom microservices architecture is built.

Scope note: The requirements above describe the planned solution. Email or SMS notifications, asset-management integration, laptop procurement, SLA tracking and dashboards are not listed as implemented because they are outside the current project scope.
